## Partial Fraction Expansion

Examples are provided below for performing Partial Fraction Expansion (PFE) using the following methods:

1) by hand
2) using the TI-85 or TI-86 calculator
3) using the HP-48G or HP-48GX calculator
4) using the TI-89 or TI-92 calculator

## Case 1: Functions with repeated linear roots

Consider the following example:

$$
F(s)=\frac{6 s}{(s+1)(s+2)^{2}}
$$

F(s) should be decomposed for Partial Fraction Expansion as follows:

$$
F(s)=\frac{6 s}{(s+1)(s+2)^{2}}=\frac{A}{s+1}+\frac{B}{s+2}+\frac{C}{(s+2)^{2}}
$$

## A) Find A, B, and C by hand:

Using the residue method:

$$
\begin{aligned}
& \mathrm{A}=\left.(\mathrm{s}+1) \mathrm{F}(\mathrm{~s})\right|_{s=-1}=\left.\frac{6 \mathrm{~s}}{(\mathrm{~s}+2)}\right|_{\mathrm{s}=-1}=\frac{-6}{1^{2}}=-6 \\
& \mathrm{C}=\left.(\mathrm{s}+2)^{2} \mathrm{~F}(\mathrm{~s})\right|_{s=-2}=\left.\frac{6 \mathrm{~s}}{(\mathrm{~s}+1)}\right|_{\mathrm{s}=-2}=\frac{-12}{-1}=12 \\
& \mathrm{~B}=\left.\frac{\mathrm{d}}{\mathrm{ds}}(\mathrm{~s}+2)^{2} \mathrm{~F}(\mathrm{~s})\right|_{s=-2}=\left.\frac{\mathrm{d}}{\mathrm{ds}}\left[\frac{6 \mathrm{~s}}{(\mathrm{~s}+1)}\right]\right|_{\mathrm{s}=-2}=\left.\frac{6}{(\mathrm{~s}+1)^{2}}\right|_{\mathrm{s}=-2}=\frac{6}{(-1)^{2}}=6
\end{aligned}
$$

so $F(s)=\frac{6 s}{(s+1)(s+2)^{2}}=\frac{-6}{s+1}+\frac{6}{s+2}+\frac{12}{(s+2)^{2}} \quad$ and $f(t)=\left[-6 e^{-t}+(6+12 t) e^{-2 t}\right] u(t)$

## B) Find A, B, and C using the TI-85 or TI-86:

$$
F(s)=\frac{6 s}{(s+1)(s+2)^{2}}=\frac{A}{s+1}+\frac{B}{s+2}+\frac{C}{(s+2)^{2}}
$$

Use the TI-85 or TI-86 to determine $\mathrm{A}, \mathrm{B}$, and C as follows:
(Calculator prompts are shown below in upper case ITALICS and user inputs are shown BOLD)

NUMBER OF DISTINCT LINEAR FACTORS 2
NUMBER OF DISTINCT QUADRATIC FACTORS 0
ENTER COEFFICIENTS AND ORDER OF EACH LINEAR FACTOR BY DESCENDING POWERS.
COEFFICIENTS OF LINEAR FACTOR NUMBER $1 \quad 1$
ORDER OF LINEAR FACTOR NUMBER 2
COEFFICIENTS OF LINEAR FACTOR NUMBER $2 \mathbf{1}$
ORDER OF LINEAR FACTOR NUMBER 2
2
ENTER DEGREE OF NUMERATOR 1

ENTER COEFFICIENTS OF NUMERATOR BY DESCENDING POWERS
The result is stored in LIST under the variable name CONST (Select LIST - NAMES - CONST)
$\left\{\begin{array}{llll}-6 & 6 & 12\end{array}\right\}$
so $F(s)=\frac{6 s}{(s+1)(s+2)^{2}}=\frac{-6}{s+1}+\frac{6}{s+2}+\frac{12}{(s+2)^{2}} \quad$ and $f(t)=\left[-6 e^{-t}+(6+12 t) \mathrm{e}^{-2 t}\right] u(t)$
C) Find A, B, and C using the HP-48G or HP-48GX:

$$
F(s)=\frac{6 s}{(s+1)(s+2)^{2}}=\frac{A}{s+1}+\frac{B}{s+2}+\frac{C}{(s+2)^{2}}
$$

Use the HP-48G or HP-48GX to determine A, B, and C as follows:

1. Load the information onto the stack as follows:

| Stack Contents | Comments |
| :--- | :--- |
| $\left\{\begin{array}{ll}6 & 0\end{array}\right\}$ | Coefficients in the numerator of F(s) |
| $\left\{\begin{array}{ll}1 & 1\end{array}\right\}$ | Coefficients for $1^{\text {st }}$ factor in denominator |
| 1 | Power to which the $1^{\text {st }}$ factor is raised |
| $\left\{\begin{array}{ll}1 & 2\end{array}\right\}$ | Coefficients for $2^{\text {nd }}$ factor in denominator |
| 2 | Power to which the $2^{\text {nd }}$ factor is raised |
| 2 | The total number of factors in the denominator |

2. Run the program PARTIALF (located in the directory BOBM).
3. The results will now appear on the stack (in the same order as the factors were entered).

$$
\left\{\begin{array}{lll}
-6 & 6 & 12
\end{array}\right\}
$$

so $F(s)=\frac{6 s}{(s+1)(s+2)^{2}}=\frac{-6}{s+1}+\frac{6}{s+2}+\frac{12}{(s+2)^{2}} \quad$ and $\mathrm{f}(\mathrm{t})=\left[-6 \mathrm{e}^{-t}+(6+12 \mathrm{t}) \mathrm{e}^{-2 \mathrm{t}}\right] \mathrm{u}(\mathrm{t})$

## Case 2: Functions with complex roots

If a function $\mathrm{F}(\mathrm{s})$ has a complex pole (i.e., a complex root in the denominator), it can be handled in two ways:

1) By keeping the complex roots in the form of a quadratic
2) By finding the complex roots and using complex numbers to evaluate the coefficients

Example: Both methods will be illustrated using the following example. Note that the quadratic terms has complex roots.

$$
F(s)=\frac{5 s^{2}-6 s+21}{(s+1)\left(s^{2}+2 s+17\right)}
$$

## Method 1: Quadratic factors in F(s)

F(s) should be decomposed for Partial Fraction Expansion as follows:
$F(s)=\frac{5 s^{2}-6 s+21}{(s+1)\left(s^{2}+2 s+17\right)}=\frac{A}{s+1}+\frac{B s+C}{s^{2}+2 s+17}$

## A) Find A, B, and C by hand (for the quadratic factor method):

Combining the terms on the right with a common denominator and then equating numerators yields: $A\left(s^{2}+2 s+17\right)+(B s+C)(s+1)=5 s^{2}-6 s+21$
$\left.\begin{array}{l}\text { Equating } \mathrm{s}^{2} \text { terms: } \mathrm{A}+\mathrm{B}=5 \\ \text { Equating } \mathrm{s} \text { terms: } \quad 2 \mathrm{~A}+\mathrm{B}+\mathrm{C}=-6 \\ \text { Equating constants: } 17 \mathrm{~A}+\mathrm{C}=21\end{array}\right\} \quad$ yields $\quad\left\{\begin{array}{l}\mathrm{A}=2 \\ \mathrm{~B}=3 \\ \mathrm{C}=-13\end{array}\right.$
so $F(s)=\frac{5 s^{2}-6 s+21}{(s+1)\left(s^{2}+2 s+17\right)}=\frac{2}{s+1}+\frac{3 s-13}{s^{2}+2 s+17}$
now manipulating the quadratic term into the form for decaying cosine and sine terms:

$$
F(s)=\frac{2}{s+1}+\frac{3(s+1)}{(s+1)^{2}+4^{2}}+\frac{-4(4)}{(s+1)^{2}+4^{2}}
$$

so $f(t)=e^{-t}[2+3 \cos (4 t)-4 \sin (4 t)] u(t)$

The two sinusoidal terms may be combined if desired using the following identity:
$\mathrm{A} \cos (\mathrm{wt})+\mathrm{B} \sin (\mathrm{wt})=\sqrt{\mathrm{A}^{2}+\mathrm{B}^{2}} \cos \left(\mathrm{wt}-\tan ^{-1}\left(\frac{\mathrm{~B}}{\mathrm{~A}}\right)\right)$
(or convert (A, -B) to polar form)
so $f(t)=e^{-t}\left[2+5 \cos \left(4 t+53.13^{\circ}\right)\right] u(t)$

## B) Find A, B, and C using the TI-85 or TI-86 (for the quadratic factor method)

F(s) should be decomposed for Partial Fraction Expansion as follows:

$$
F(s)=\frac{5 s^{2}-6 s+21}{(s+1)\left(s^{2}+2 s+17\right)}=\frac{A}{s+1}+\frac{B s+C}{s^{2}+2 s+17}
$$

Use the TI-85 to determine A, B, and C as follows:
Run the program PARTIALF (Select PROGRAM - NAMES - PARTIALF)
(Calculator prompts are shown below in upper case ITALICS and user inputs are shown BOLD)
NUMBER OF DISTINCT LINEAR FACTORS 1
NUMBER OF DISTINCT QUADRATIC FACTORS 1
ENTER COEFFICIENTS AND ORDER OF EACH LINEAR FACTOR BY DESCENDING POWERS.
COEFFICIENTS OF LINEAR FACTOR NUMBER 1 1
ORDER OF LINEAR FACTOR NUMBER 1 1
ENTER COEFFICIENTS AND ORDER OF QUADRATIC FACTORS BY DESCENDING POWERS.
COEFFICIENTS OF QUADRATIC FACTOR NUMBER $1 \quad 1$

ORDER OF QUADRATIC FACTOR NUMBER I 1
ENTER DEGREE OF NUMERATOR $\mathbf{2}$
ENTER COEFFICIENTS OF NUMERATOR BY DESCENDING POWERS $\mathbf{5}$

The result is stored in LIST under the variable name CONST (Select LIST - NAMES - CONST)
$\{2.0000 \quad 3.0000-13.0000\}$
so $F(s)=\frac{5 s^{2}-6 s+21}{(s+1)\left(s^{2}+2 s+17\right)}=\frac{2}{s+1}+\frac{3 s-13}{s^{2}+2 s+17}$
so $f(t)=e^{-t}[2+3 \cos (4 t)-4 \sin (4 t)] u(t) \quad$ or $\quad f(t)=e^{-t}\left[2+5 \cos \left(4 t+53.13^{\circ}\right)\right] u(t)$
(see above for details on finding $\mathrm{f}(\mathrm{t})$ from $\mathrm{F}(\mathrm{s})$ )
C) Find A, B, and C using the HP-48G or HP-48GX (for the quadratic factor method)

F(s) should be decomposed for Partial Fraction Expansion as follows:
$F(s)=\frac{5 s^{2}-6 s+21}{(s+1)\left(s^{2}+2 s+17\right)}=\frac{A}{s+1}+\frac{B s+C}{s^{2}+2 s+17}$

Use the HP-48 to determine A, B, and C as follows:

1. Load the information onto the stack as follows:

| Stack Contents | Comments |
| :--- | :--- |
| $\left\{\begin{array}{lll}5 & -6 & 21\end{array}\right\}$ | Coefficients in the numerator of F(s) |
| $\left\{\begin{array}{lll}1 & 1\end{array}\right\}$ | Coefficients for $1^{\text {st }}$ factor in denominator |
| 1 | Power to which the $1^{\text {st }}$ factor is raised |
| $\left\{\begin{array}{lll}1 & 2 & 17\end{array}\right\}$ | Coefficients for $2^{\text {nd }}$ factor in denominator |
| 1 | Power to which the $2^{\text {nd }}$ factor is raised |
| 2 | The total number of factors in the denominator |

3. Run the program PARTIALF (located in the directory BOBM so use $2^{\text {nd }}$-HOME-VAR-BOBM).
4. The results will now appear on the stack (in the same order as the factors were entered).
$\left\{\begin{array}{lll}2 & 3 & -13\end{array}\right\}$
so $F(s)=\frac{5 s^{2}-6 s+21}{(s+1)\left(s^{2}+2 s+17\right)}=\frac{2}{s+1}+\frac{3 s-13}{s^{2}+2 s+17}$
so $\mathrm{f}(\mathrm{t})=\mathrm{e}^{-\mathrm{t}}[2+3 \cos (4 \mathrm{t})-4 \sin (4 \mathrm{t})] \mathrm{u}(\mathrm{t}) \quad$ or $\quad \mathrm{f}(\mathrm{t})=\mathrm{e}^{-\mathrm{t}}\left[2+5 \cos \left(4 \mathrm{t}+53.13^{\circ}\right)\right] \mathrm{u}(\mathrm{t})$
(see above for details on finding $f(t)$ from $F(s)$ )
Method 2: Complex roots in $\mathrm{F}(\mathrm{s})$
Note that the roots of $\left(s^{2}+2 s+17\right)$ are $s_{1}, s_{2}=\alpha \pm j w=-1 \pm j 4$
so $F(s)=\frac{5 s^{2}-6 s+21}{(s+1)\left(s^{2}+2 s+17\right)}=\frac{5 s^{2}-6 s+21}{(s+1)(s+1-j 4)(s+1+j 4)}$

## A) Find A, B, and C by hand (for the complex root method):

F(s) should be decomposed for Partial Fraction Expansion as follows:
$F(s)=\frac{A}{s+1}+\frac{\overline{\mathbf{B}}}{s+1-j 4}+\frac{\overline{\mathbf{B}}^{*}}{\mathrm{~s}+1+\mathrm{j} 4} \quad$ where $\overline{\mathbf{B}}$ is a complex number and $\overline{\mathbf{B}}^{*}$ is the conjugate of $\overline{\mathbf{B}}$.

The inverse transform of the two terms with complex roots will yield a single time-domain term of the form $2 \overline{\mathbf{B}}=2 \mathrm{~B} \underline{\theta}=2 \mathrm{Be}^{\alpha \mathrm{t}} \cos (\mathrm{wt}+\theta)$

Using the Residue Theorem:
$\mathrm{A}=\left.(\mathrm{s}+1) \mathrm{F}(\mathrm{s})\right|_{\mathrm{s}=-1}=\left.\frac{5 \mathrm{~s}^{2}-6 \mathrm{~s}+21}{\left(\mathrm{~s}^{2}+2 \mathrm{~s}+17\right)}\right|_{\mathrm{s}=-1}=\frac{32}{16}=2$

$$
\begin{aligned}
\overline{\mathbf{B}}=\left.(\mathrm{s}+1-\mathrm{j} 4) \mathrm{F}(\mathrm{~s})\right|_{\mathrm{s}=-1+\mathrm{j} 4} & =\left.\frac{5 \mathrm{~s}^{2}-6 \mathrm{~s}+21}{(\mathrm{~s}+1)(\mathrm{s}+1+\mathrm{j} 4)}\right|_{\mathrm{s}=-1+\mathrm{j} 4} \\
& =\frac{5(-1,4)^{2}-6(-1,4)+21}{(-1+\mathrm{j} 4+1)(-1+\mathrm{j} 4+1+\mathrm{j} 4)}=2.5 \underline{/ 53.13^{\circ}}
\end{aligned}
$$

It is not necessary to also find $\overline{\mathbf{B}}^{*}$, but doing so here illustrates the conjugate relationship.

$$
\begin{aligned}
\overline{\mathbf{B}}^{*}=\left.(\mathrm{s}+1+\mathrm{j} 4) \mathrm{F}(\mathrm{~s})\right|_{\mathrm{s}=-1-j 4} & =\left.\frac{5 \mathrm{~s}^{2}-6 \mathrm{~s}+21}{(\mathrm{~s}+1)(\mathrm{s}+1-\mathrm{j} 4)}\right|_{\mathrm{s}=-1-\mathrm{j} 4} \\
& =\frac{5(-1,-4)^{2}-6(-1,-4)+21}{(-1-\mathrm{j} 4+1)(-1-\mathrm{j} 4+1-\mathrm{j} 4)}=2.5 \underline{/-53.13^{\circ}}
\end{aligned}
$$

So, $\mathrm{f}(\mathrm{t})=2 \mathrm{e}^{-\mathrm{t}} \mathrm{u}(\mathrm{t})+2 \mathrm{~B} / \underline{\theta}=2 \mathrm{e}^{-\mathrm{t}} \mathrm{u}(\mathrm{t})+5 / 53.13^{\circ}$

$$
\mathrm{f}(\mathrm{t})=\left[2 \mathrm{e}^{-\mathrm{t}}+5 \mathrm{e}^{-\mathrm{t}} \cos \left(4 \mathrm{t}+53.13^{\circ}\right)\right] \mathrm{u}(\mathrm{t})
$$

This can be broken up into separate sine and cosine terms using

$$
\cos (\mathrm{wt}+\theta)=\cos (\theta) \cos (\mathrm{wt})-\sin (\theta) \sin (\mathrm{wt})
$$

(or convert ( $\mathrm{R}, \underline{/ \theta}$ ) to ( $\mathrm{A},-\mathrm{B}$ ) )
so $f(t)=\left[2 \mathrm{e}^{-t}+5 \mathrm{e}^{-t}\left[\cos \left(53.13^{\circ}\right) \cos (4 \mathrm{t})-\sin \left(53.13^{\circ}\right) \sin (4 \mathrm{t})\right]\right] \mathrm{u}(\mathrm{t})$

$$
f(t)=\left[2 e^{-t}+e^{-t}[4 \cos (4 t)-3 \sin (4 t)]\right] u(t)
$$

## B) Find A, B, and C using the TI-85 or TI-86 (for the complex root method)

F(s) should be decomposed for Partial Fraction Expansion as follows:
$F(s)=\frac{5 s^{2}-6 s+21}{(s+1)\left(s^{2}+2 s+17\right)}=\frac{A}{s+1}+\frac{\overline{\mathbf{B}}}{s+1-j 4}+\frac{\overline{\mathbf{B}}^{*}}{s+1+j 4}$
Use the TI-85 to determine A, $\overline{\mathbf{B}}$, and $\overline{\mathbf{B}}^{*}$ as follows:
Run the program PARTIALF (Select PROGRAM - NAMES - PARTIALF)
(Calculator prompts are shown below in upper case ITALICS and user inputs are shown BOLD)
NUMBER OF DISTINCT LINEAR FACTORS 3
NUMBER OF DISTINCT QUADRATIC FACTORS 0
ENTER COEFFICIENTS AND ORDER OF EACH LINEAR FACTOR BY DESCENDING POWERS.
COEFFICIENTS OF LINEAR FACTOR NUMBER $1 \quad 1$
ORDER OF LINEAR FACTOR NUMBER 1
ORDER OF LINEAR FACTOR NUMBER 2 1
COEFFICIENTS OF LINEAR FACTOR NUMBER 3
ORDER OF LINEAR FACTOR NUMBER 3 1
ENTER DEGREE OF NUMERATOR 2
ENTER COEFFICIENTS OF NUMERATOR BY DESCENDING POWERS
The result is stored in LIST under the variable name CONST (Select LIST - NAMES - CONST)
$\{(2.0 / \underline{0.00})(2.5 \underline{/ 53.13})(2.5 \underline{/-53.13})\}$
so

$$
\mathrm{f}(\mathrm{t})=\left[2 \mathrm{e}^{-\mathrm{t}}+5 \mathrm{e}^{-\mathrm{t}} \cos \left(4 \mathrm{t}+53.13^{\circ}\right)\right] \mathrm{u}(\mathrm{t}) \text { or } \mathrm{f}(\mathrm{t})=\left[2 \mathrm{e}^{-\mathrm{t}}+\mathrm{e}^{-\mathrm{t}}[4 \cos (4 \mathrm{t})-3 \sin (4 \mathrm{t})]\right] \mathrm{u}(\mathrm{t})
$$

(see above for details on finding $\mathrm{f}(\mathrm{t})$ from $\mathrm{F}(\mathrm{s})$ )
C) Find A, B, and C using the HP-48G or HP-48GX (for the complex root method)
F(s) should be decomposed for Partial Fraction Expansion as follows:

$$
F(s)=\frac{5 s^{2}-6 s+21}{(s+1)\left(s^{2}+2 s+17\right)}=\frac{A}{s+1}+\frac{\overline{\mathbf{B}}}{s+1-j 4}+\frac{\overline{\mathbf{B}}^{*}}{s+1+j 4}
$$

Use the HP-48 to determine $\mathrm{A}, \overline{\mathbf{B}}$, and $\overline{\mathbf{B}}^{*}$ as follows:

1. Load the information onto the stack as follows:

| Stack Contents | Comments |
| :--- | :--- |
| $\left\{\begin{array}{ll}5-6 & 21\end{array}\right\}$ | Coefficients in the numerator of $\mathrm{F}(\mathrm{s})$ |
| $\left\{\begin{array}{ll}1 & 1\end{array}\right\}$ | Coefficients for $1^{\text {st }}$ factor in denominator |
| 1 | Power to which the $1^{\text {st }}$ factor is raised |
| $\{1(1,-4)\}$ | Coefficients for $2^{\text {nd }}$ factor in denominator |
| 1 | Power to which the $2^{\text {nd }}$ factor is raised |
| $\{1(1,4)\}$ | Coefficients for $3^{\text {rd }}$ factor in denominator |
| 1 | Power to which the $3^{\text {rd }}$ factor is raised |
| 3 | The total number of factors in the denominator |

2. Run the program PARTIALF (located in the directory BOBM).
3. The results will now appear on the stack (in the same order as the factors were entered).
$\{(2,0)(2.5 /-53.13)(2.5 /+53.13)\}$
so

$$
\mathrm{f}(\mathrm{t})=\left[2 \mathrm{e}^{-\mathrm{t}}+5 \mathrm{e}^{-\mathrm{t}} \cos \left(4 \mathrm{t}+53.13^{\circ}\right)\right] \mathrm{u}(\mathrm{t}) \text { or } \mathrm{f}(\mathrm{t})=\left[2 \mathrm{e}^{-\mathrm{t}}+\mathrm{e}^{-\mathrm{t}}[4 \cos (4 \mathrm{t})-3 \sin (4 \mathrm{t})]\right] \mathrm{u}(\mathrm{t})
$$

(see above for details on finding $\mathrm{f}(\mathrm{t})$ from $\mathrm{F}(\mathrm{s})$ )

## Transferring the Partial Fractions Expansion program between calculators

## TI-85 or TI-86

1) Connect the two calculators with a cable
2) On the receiving calculator, select $2^{\text {nd }}$ - LINK - RECV
3) On the sending calculator, select
$2^{\text {nd }}$ - LINK - SEND - PRGM
then either select the desired programs or press $\boldsymbol{A L L}+$ to select all programs then select XMIT

## HP-48G or HP-48GX

1) Line up the arrows on the top each calculator corresponding to the infared port
2) On the receiving calculator, select $\boldsymbol{H O M E}$ to insure that the calculator is in the HOME directory Then select I/O and then GET FROM HP 48
3) On the sending calculator, select HOME

Then select I/O and then SEND TO HP 48
Then select EDIT - VAR - BOBM - ENTER (this selects the entire BobMaynard directory, including all subprograms, for transfer)
Then select $\boldsymbol{S E N D}$

## Partial Fractions Decomposition with the TI-89/TI-92

1) From the Algebra pull down menu (F2) select 3: expand( either by using the cursor key to highlight the function then pressing enter, or entering $\mathbf{3}$ on the numeric keypad.
2) Enter the rational expression you wish to perform partial fraction decomposition on.

CAUTION: be sure to use parentheses as needed to ensure proper grouping of terms in the numerator and denominator.
3) Close the expand( function with a right parenthesis.
4) Press enter.

## Example:

To perform partial fraction decomposition of the expression

$$
\frac{s+2}{s \cdot(s+1)^{3}}
$$

1) Select the expand function
expand(
2) Enter $(\mathrm{s}+2) /\left(\mathrm{s}^{*}(\mathrm{~s}+1)^{\wedge} 3\right)$

$$
\operatorname{expand}\left((s+2) /\left(s^{*}(s+1)^{\wedge} 3\right)\right.
$$

3) Close the parentheses on the expand function

$$
\operatorname{expand}\left((s+2) /\left(s^{*}(s+1)^{\wedge} 3\right)\right)
$$

4) Press Enter. The calculator will display the result

$$
\frac{-2}{s+1}+\frac{-2}{(s+1)^{2}}+\frac{-1}{(s+1)^{3}}+\frac{2}{s}
$$
